Objective

Create a high-quality HTML5 playable ad based on the provided example reference. Each playable should demonstrate the core gameplay, interaction, or product experience in a short, engaging format suitable for mobile ad networks.

The goal is to produce a lightweight, responsive, self-contained playable ad that can run reliably across major ad platforms and devices. This playable will have 3 iterations with one output each. The end card/call-to-action screen will become active after satisfying the iteration's limitations/requirements.

Scope

Developers will create a playable ad based on the provided references and project requirements.

The playable should include:

- Clear user onboarding through visual cues or simple instructions
- Responsive layout for portrait and/or landscape orientation
- A clear end state or call-to-action screen
- Optimized assets and performance
- Compatibility with major mobile browsers and ad network environments.

Networks include:

- Applovin
- Facebook
- Google
- IronSource
- Mintegral
- Moloco
- Unity
- Vungle
- The playable should not require external servers, CDN assets, or runtime downloads.

Technologies Required

Developers may use the following technologies:

- PhaserJS for game logic, scenes, animation, interaction, and rendering
- Vite for local development and build tooling

- NodeJS for package management and build scripts
- JavaScript or TypeScript
- HTML5, CSS, Canvas
- Claude, Codex, or similar AI coding tools may be used to assist development

Deliverables

Each playable submission must include:

1. Single HTML Output
 - a. A final self-contained .html file
 - b. All scripts, styles, and assets embedded directly
 - c. No external dependencies at runtime
2. Repository / Source Project
 - a. Full source code
 - b. Organized asset folders
 - c. Build scripts
 - d. README with setup and build instructions
3. Build Output
 - a. Final playable HTML file
 - b. Any required network-specific variants, if applicable
4. Documentation
 - a. Brief description of the playable
 - b. Controls/interactions
 - c. Build instructions
 - d. Known limitations, if any

Technical Requirements

The playable must meet the following requirements unless otherwise specified per project.

File Format

- Final output must be a single HTML file
- No external image, audio, font, script, or stylesheet requests
- All assets must be embedded using base64 or inlined where appropriate
- The playable must run by opening the HTML file directly in a browser
- File size under 5MB

Interactions

- Tutorial - show an animated hand at the start of the playable with a 0.75% opaque overlay to isolate the necessary game object as needed
- Hand hint - show an animated hand guiding the player how to interact with the player after 5s of inactivity
- Redirection behavior - redirect the player to the store page at the end of the playable right before showing the end screen, and clicking anywhere on the end

screen

Responsiveness

Playable should support:

- Mobile portrait and landscape layout
- Safe-area handling for notched devices
- Proper scaling across common resolutions

Iterations

Playable should show the end card/cta screen after:

- 10 clicks
- 60 seconds
- Full

Performance

Playable should:

- Load quickly
- Avoid long startup delays
- Maintain smooth interaction on mid-range mobile devices
- Avoid unnecessary memory usage
- Avoid large unused assets or libraries

Ad Network Readiness

Playable should be compatible with common playable ad environments.

Where applicable, it should support:

- Click-through behavior
- CTA screen
- Replay or end-card state
- Network-specific export naming or wrappers
- No console errors during runtime

Evaluation Criteria

Criteria	Description	Score
Gameplay Functionality	Interaction works correctly, progression works smoothly. Expected results are present.	30%
Visual Quality	Assets are clear, no visual jitter and inconsistencies. Output is clean and polished.	20%
User Experience	Gameplay is easy to	20%

	understand, responsive, and satisfying.	
Technical Performance	Build loads properly, runs smoothly, and is optimized for mobile playable use.	15%
Completion & Polish	Includes full gameplay flow, CTA, and minimal bugs/artifacts	15%
Total		100%
Passing Score		85%

Submission Requirements

Each developer must submit:

- Source repository or zipped source project
- Final single HTML playable file
- README file
- Build instructions
- Notes for any assumptions or deviation.

Timeline

Day 1:

- Gameplay
- UI

Day 2:

- Network requirements
- Interaction
- Juicing (VFX and SFX)

Playable Description

The playable starts with an empty scene that gradually becomes filled with sticker art as the player progresses.

At the beginning of each round, three sticker outlines appear in the main scene, while three matching stickers appear in a tray at the bottom of the screen. The player can only interact with the stickers in the bottom tray.

The objective is to drag each sticker from the bottom tray onto its matching outline. When a sticker is placed correctly, it snaps into position and becomes part of the scene. Once all three stickers in the current set are correctly placed, a new set of three outlines and three stickers appears.

This loop continues across multiple rounds, with the player completing each set by matching stickers to their outlines. As more stickers are placed, the once-empty scene becomes increasingly complete, creating a satisfying sense of progress and visual payoff.
